

Accounting Acquisition Analysis

For this Advanced Accounting project, I analyzed the United Technologies acquisition of Raytheon using the acquisition method under ASC 805. I examined the consideration transferred in the all-stock merger, including the shares issued and liabilities assumed, and considered how the acquired assets and liabilities should be recognized at fair value. The project also involved analyzing the effects of the acquisition on equity, investments, and other accounts on the acquiring company's books. I used information from RTX's 2020 Form 10-K, including its acquisition and equity disclosures, to connect the accounting rules from class to an actual business combination. This project helped me better understand how the accounting for a large acquisition flows through a company's financial statements.
